Portfolio - Ivo Gomes

https://www.linkedin.com/in/ivogomes/

I'm a Director of Product Design who builds design organizations and the platforms they work on.

At Talkdesk I helped grow design from 4 to 70 designers; at Dashlane I lead the whole Product Design team across B2C, B2B, and the Design System.

My work is turning fragmented products into coherent experiences, setting standards through influence rather than authority, and staying close enough to the work to prototype in code. Today I'm leading how AI changes both our product and the way we work.

Dashlane (2023-Present)

Dashlane's primary goal is to protect individuals and companies from phishing and account takeovers. At its core Dashlane is a password manager, but it is shifting to a credential manager as authentication moves toward passwordless methods, which are safer and resist phishing.

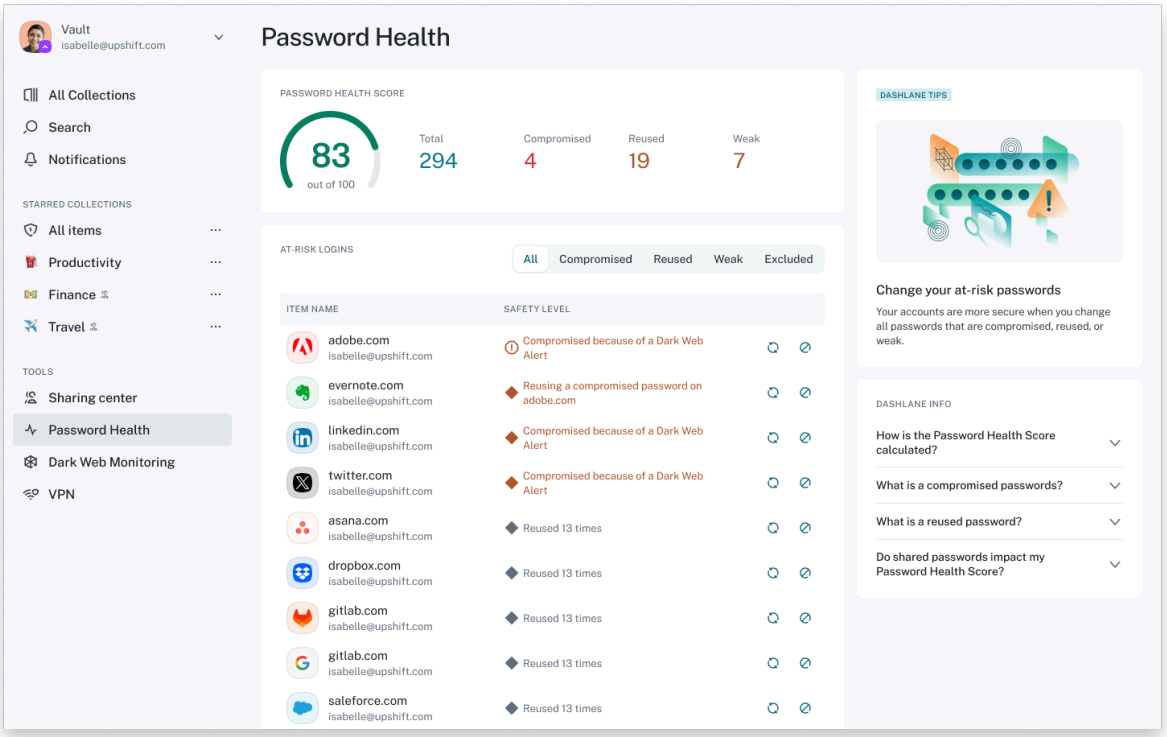

I represent Dashlane in the FIDO Alliance's UX Working Group alongside Google, Apple, and 1Password, helping shape the global UX strategy for passkeys and passwordless authentication. We work on shared UX/UI standards, run usability research, and write design guidelines to make secure, passwordless authentication intuitive for consumers and enterprises.

Director of Product Design

I lead the entire Product Design team at Dashlane, covering both B2C and B2B across every domain of the product, with seven direct reports across Portugal and France. I report to the Head of UX, who reports to the CPO, and I sit on the product-engineering-design triad that sets Dashlane's vision, direction, and roadmap. Bringing B2C and B2B under one design team meant aligning two audiences, two roadmaps, and four platforms around a single product experience. We did it mostly through the Design System and the UX Architecture Working Group, where engineers and designers contribute and validate patterns together, rather than by mandate.

I don't do individual contributor work daily, except when we need extra hands. I foster a culture of knowledge sharing and collaboration. When I joined, designers worked in silos, causing inconsistency and a lack of shared UX vision. Now we have a cohesive design team: designers remain assigned to specific triads but collaborate frequently through pair design. We also run design round tables, critiques, and studio hours with designers across domains.

UX (ease of use) is a key reason customers choose Dashlane, and we aim to preserve that as we move upmarket into enterprise customers.

Password Health Score

AI Transformation

I'm leading AI transformation across Dashlane's Product & Design organization. The goal isn't to add AI for its own sake but to identify where it truly changes how we work and where it doesn't. Rather than bet on one tool or workflow up front, designers tried different setups on real work, and we compared what held up in practice.

Discovery is where AI has already proven a big help. It supports research planning and, above all, aggregates and digests results, turning notes, transcripts, and feedback into actionable insights much faster. Design itself is changing too: some designers now work directly in code, skipping Figma. It's a big shift in how a design gets made, and it taught us what designers need from their tools.

For now, the approach that works best is a hybrid. We use AI to clone the product repository into a local copy with branches that designers can work on freely, and we still use Figma for visual alignment and consistency, as a reference for how the prototype should look. Prototypes built this way reach users much faster. We test with both real and synthetic users, but we prefer real ones. AI speeds up synthesis and prototyping, but judgment stays with people: designers review what AI produces before it becomes code, and every change

keeps a design owner. The same shift is changing our Design System, which we're adapting to be used by AI agents alongside humans.

The results of recent months are encouraging. We can build new features and improve UX, including paying down UX debt, far faster than before. Improvements that sat in the drawer since 2023 now ship in weeks, especially front-end changes.

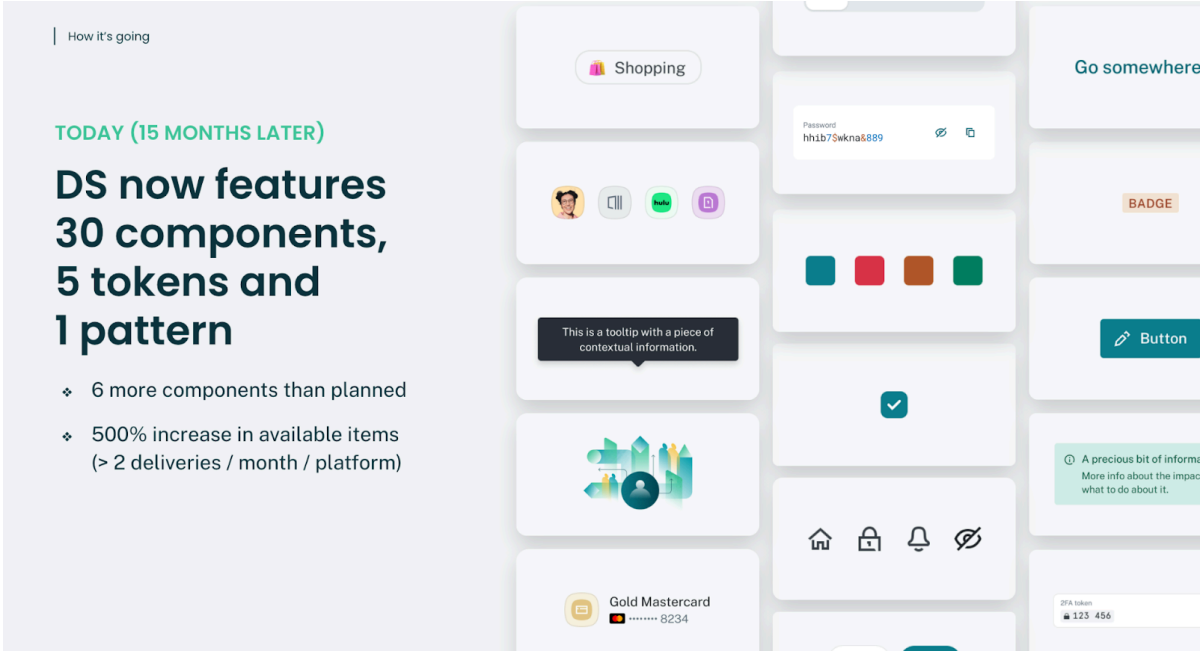

I also led the creation and distribution of AI skills across the product area, not just design. We built a shared skills repository for product, research, design, marketing, and CX, plus a collaboration system so anyone can create and share skills with the team.

Dashlane Design System

I am a fan of design systems and enjoy building them. When I joined Dashlane, the Design System had only five components and low adoption from designers and engineers. Development was slow, and before releasing a component we had to complete it for all four platforms (Figma, Web, iOS, and Android).

Soon after taking over the Design System, I created a strategy to build core components that would enable users to assemble over 80% of the product's pages. I also changed how we delivered components: we published early in Figma for designers as soon as components were ready. That increased adoption and design consistency. Within nine months, 100% of new Figma designs used only DS components, with few detachments. Since designers work a few sprints ahead of engineering, this created pull for the other platforms to catch up, or for teams to contribute components themselves.

It took longer to reach parity across platforms, but after 15 months we exceeded our goal and now have the components needed to build over 95% of pages across all platforms.

Today the focus is on making the Design System work for AI agents as well as humans. As designers and engineers increasingly build with AI, the system has to be something an agent can read and apply correctly, not just something a person can browse. That means making components, tokens, and usage guidelines explicit and machine-readable, and capturing UX architecture and patterns (such as bulk actions, filtering, and navigation) as prebuilt recipes that both people and agents can follow.

Talkdesk (2017-2023)

Talkdesk is a Contact Center in the Cloud solution that helps companies distribute their support agents throughout the world without the need for a physical contact center structure. It provides companies with multichannel communication possibilities with the goal of optimizing the time to solve their own customers' problems.

Director of Product Design

I led the CCaaS (Contact Center as a Service) design team, managing 11 direct reports from junior to senior product designers and UX researchers. I also directed strategy and operations for additional design teams in the USA and China that did not report to me. I partnered with the Product and Engineering directors to align design with the wider CCaaS strategy, scaling team capabilities, design ops, and design standards.

I played a key role in Talkdesk's product design growth, helping the team expand from 4 to nearly 70 designers across six business units worldwide.

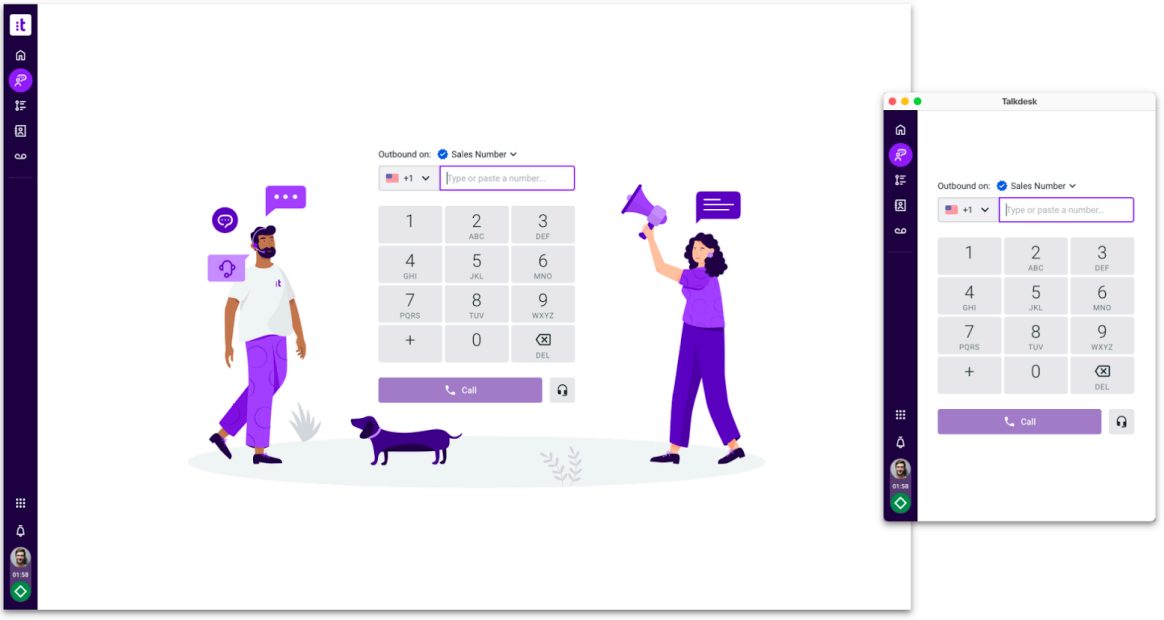

We fostered knowledge sharing and collaboration. Although each designer belonged to specific scrum teams, we ran shared ceremonies: design critiques, weekly shares, retrospectives, design all-hands, and pair-design sessions.

Agent experience

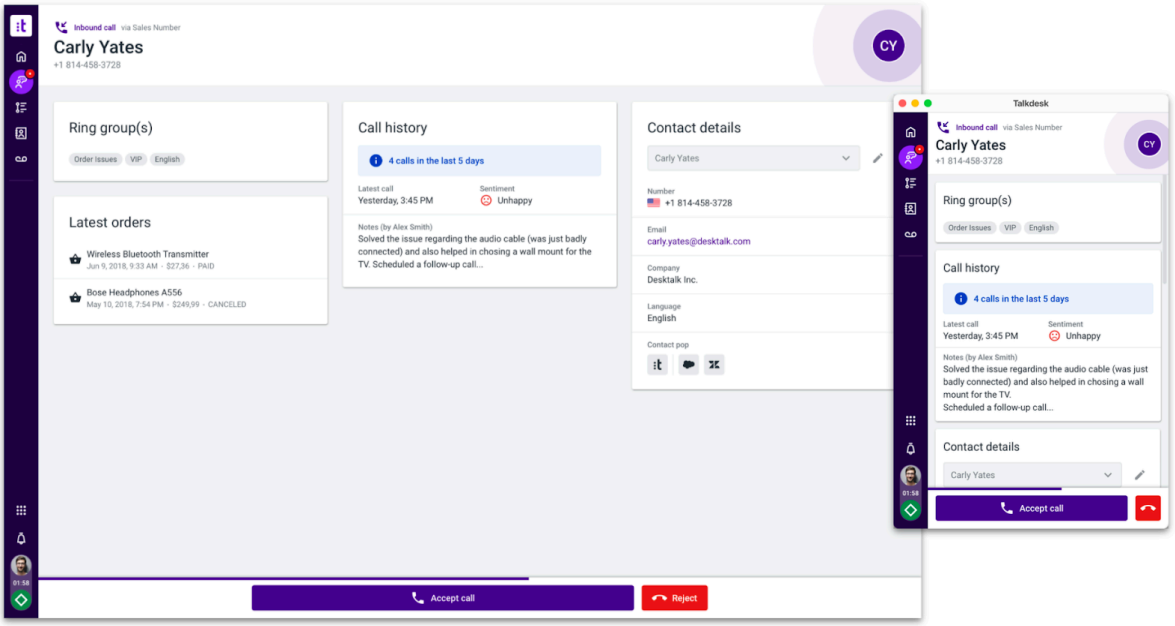

I led product design for the new agent experience at Talkdesk, focused on the voice channel. This is the web and desktop app contact center agents use to make and receive calls, manage contacts, listen to voicemails, and review activity. It's a responsive web app that runs in the browser or as a small desktop app (agents often run many apps simultaneously, so they prefer a compact desktop window).

The project relied on extensive user research (agent shadowing) and customer discovery. Before COVID we visited many contact centers to observe agents and gather feedback; afterward we did most sessions via Zoom. We also ran design sprints (here's a video of one of the first sprints) that shaped the product.

Below are screens from the Conversations app in idle, ringing, and on-call states. We designed it as a framework extendable by internal features or third-party add-ons so the agent experience can vary by call type (inbound vs. outbound; sales vs. tech support) or by customer (they can create custom cards).

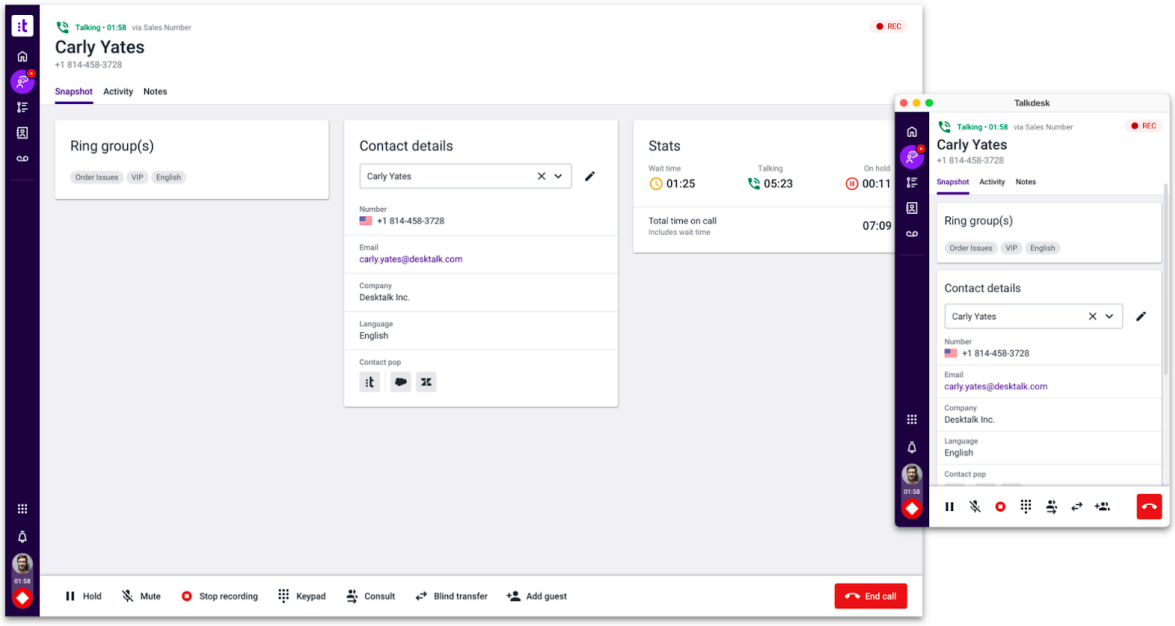

Idle

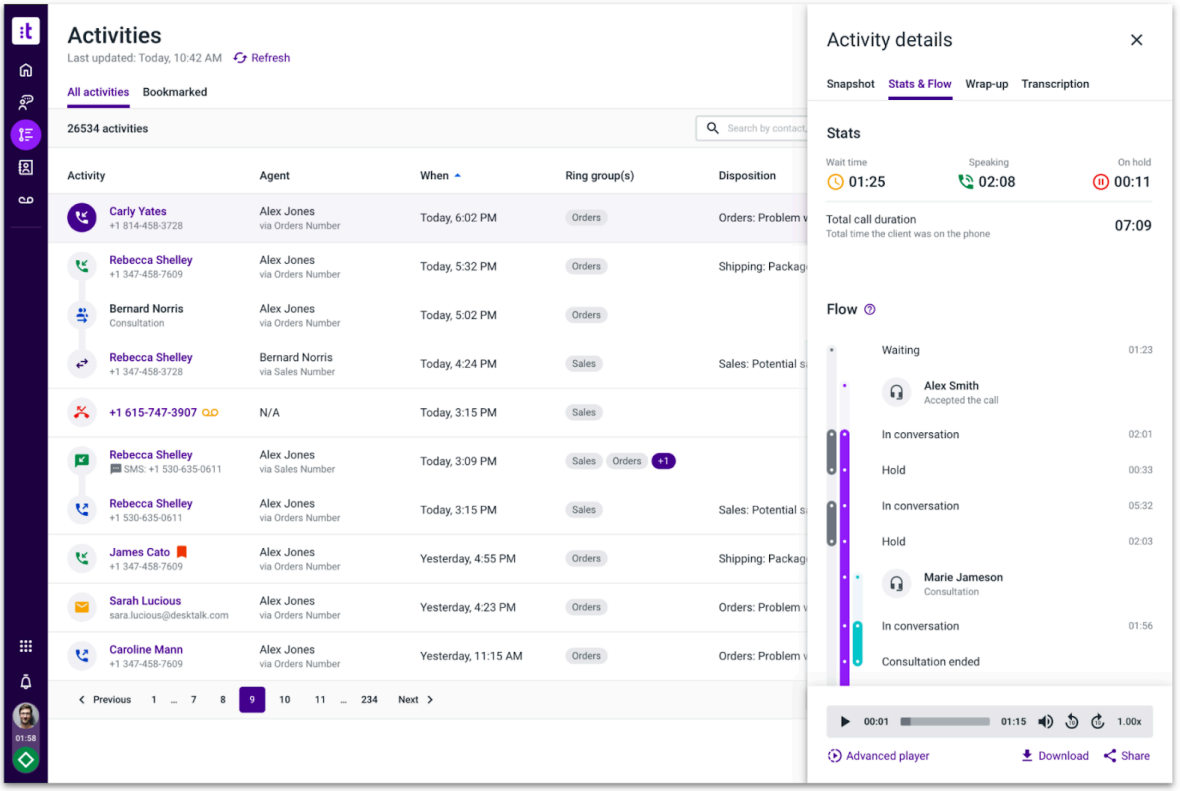

Inbound call ringing

I also used to code occasionally (before AI) to better convey desired product behavior, for example this ringing avatar animation: https://codepen.io/ivogomes/pen/vMLvVW

Call in progress

Other satellite apps, such as the Activities app, give agents and supervisors an overview of center-wide or individual activity.

Activity details

After the voice channel, we added digital channels (SMS, live chat, Facebook Messenger, WhatsApp, etc.), leveraging the expandable framework.

Talkdesk Design System

I helped build Talkdesk's Design System from scratch. In the early days I also helped a bit on the front-end (HTML/CSS) of the components to include accessibility features and to make sure the experience matched what we had imagined in the design style guide. This was done in parallel with the Sketch (later migrated to Figma) component library.

By the time I left the company, we had a dedicated team of developers and designers working on the design system, but about 80% of the Figma components were still using my original assets. I wrote a blog post about this in 2020 that can give a bit more info on how we built our design system:
https://medium.com/talkdesk-design/building-our-design-system-533b29102cd2

Bright Pixel (2016-2017)

I lead a team of 5 people at Bright Pixel while working on some media projects in partnership with Público and Google Digital News Initiative. The goal of Bright Pixel was to incubate early stage startups and also to build MVPs or POCs that could then spin-off to become their own startup.

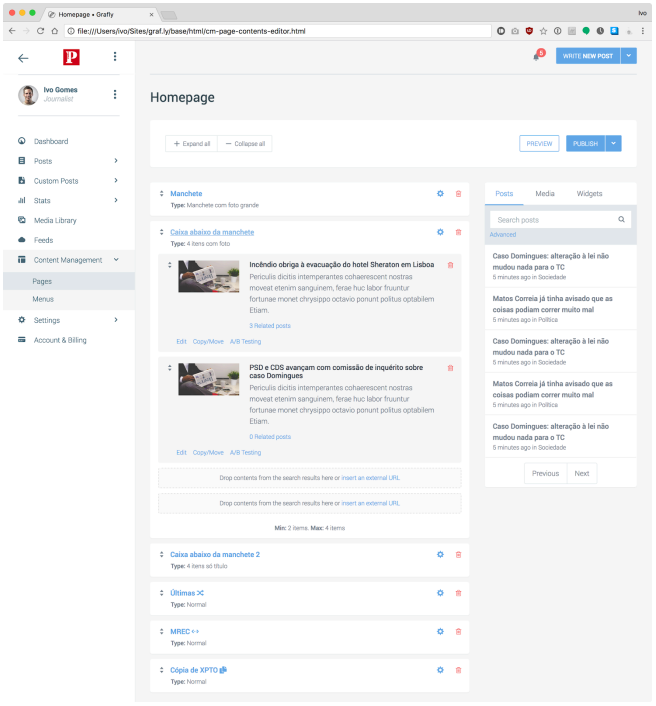

The project I was working on at the time was able to spin off into a startup called Graf.ly.

Graf.ly

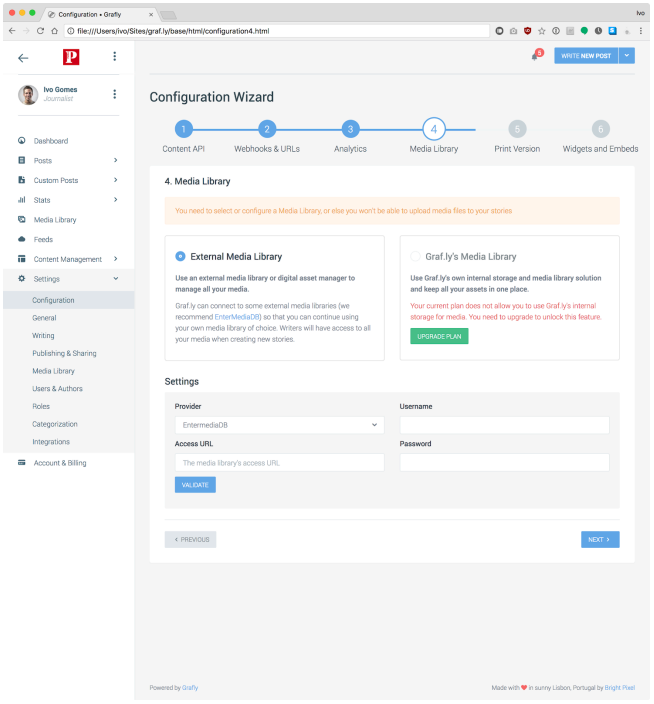

Graf.ly aimed to be the best content creation experience for journalists and editors in the newsroom. Current tools are really hard to use and are also inadequate and inefficient for a newsroom. Journalists have to deal with complicated content management systems when they should be focused on creating great content.

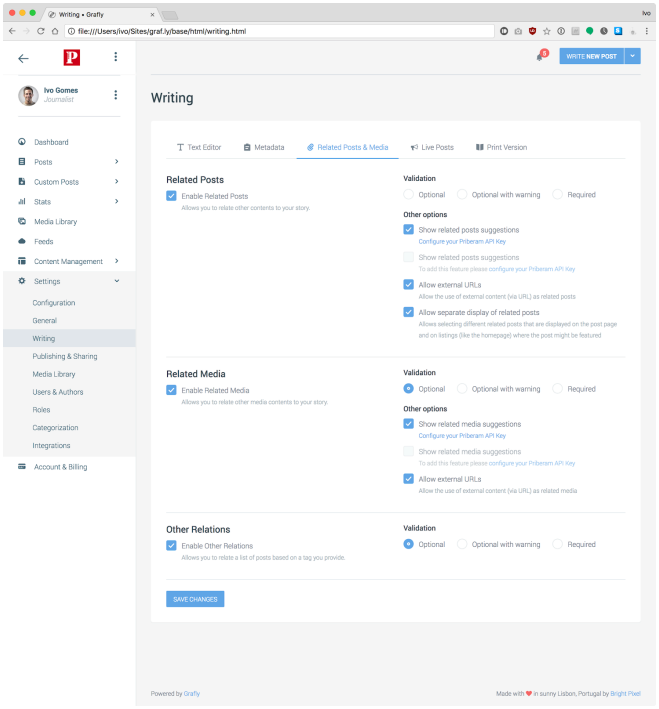

Graf.ly provided a simple workflow and an immersive writing experience so that content creators could focus on creating great content. It was a Content API that could be used to publish content in any medium (web, mobile, print, etc) and I was responsible for the entire product, from the specifications, features list, user experience, design and most HTML/CSS.

I was also doing the role of CEO, which meant pitching the product to investors and leading the team. In the end, we ended up not moving forward because of a conflict of interests between our first customer (Público) and our main investor (Sonae).

Se olharmos para um adepto de futebol que vê o seu clube em campo, podemos ver comportamentos excessivos, gritos, choro, explosões de alegria, uma mistura entre amor tribal e fanatismo. Se, por outro lado, olharmos para os circuitos do cérebro desse mesmo adepto, comprovamos que não estamos longe da verdade. Um estudo de imagem cerebral realizado por uma equipa de cientistas da Universidade de Coimbra concluiu que os circuitos cerebrais activados em elementos de claques de futebol do Académica e do Futebol Clube do Porto (FCP) são os semelhantes aos que o "amor romântico" desperta.
Ao longo de três anos, os investigadores do Instituto de Ciências Nucleares Aplicadas à Saúde (ICNAS) da Universidade de Coimbra (UC) "estudaram o cérebro de 56 adeptos, na sua maioria das claques oficiais da Académica e Futebol Clube do Porto, cujo nível de paixão foi avaliado através de *scores* de avaliação psicológica", refere um comunicado da UC divulgado esta segunda-feira sobre o estudo publicado na revista *Social Cognitive and Affective Neuroscience*.

Content Management System for the newsroom

Portugal Telecom / SAPO (2009-2016)

SAPO.PT is what we used to call the portuguese Yahoo! At the time it was the most visited website in Portugal and it is part of Portugal Telecom group. Although most of my work was

focused on SAPO, we also worked with other companies in the group doing UX and design tasks.

Head of UX

I managed the UX and QA team at SAPO. We had 5 UX designers and 2 QA engineers that allowed us to help the design and development teams at SAPO build our products. At the time, UX and Design teams were separate. We did mostly the discovery, research, user testing, and heuristic analysis of our products in parallel with the design and development teams.

SAPO.PT

At the time, the most visited webpage in Portugal, I was responsible for the usability, accessibility and overall user experience of SAPO's homepage from 2009 to 2015.

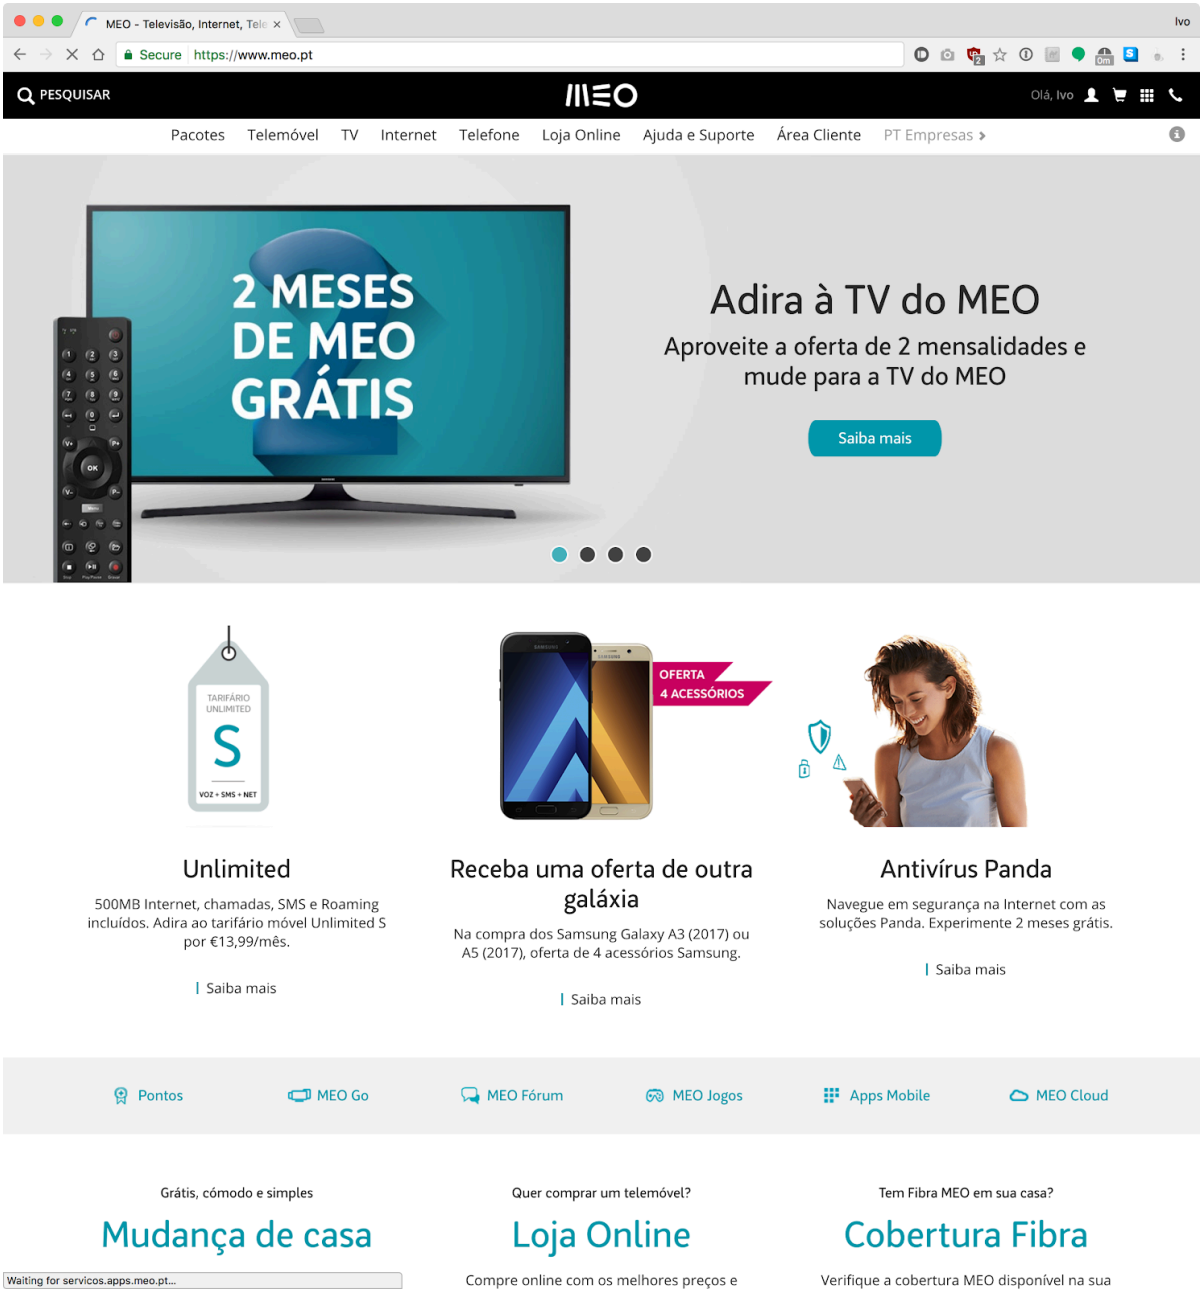

What I did: Specifications, Sketches, Wireframes, User Testing, Eyetracking, Card Sorting, Interviews/Questionnaires and other usability methodologies, also some HTML/CSS

MEO.PT / PT Empresas

From 2012 to 2015 I was responsible for the overall user experience of MEO's website, the main 3P (TV, Internet, Voice/Mobile) player in Portugal.

After that, the enterprise website (PT Empresas) was also revamped using the same specification and wireframes (with some adaptation) of what was designed for MEO.

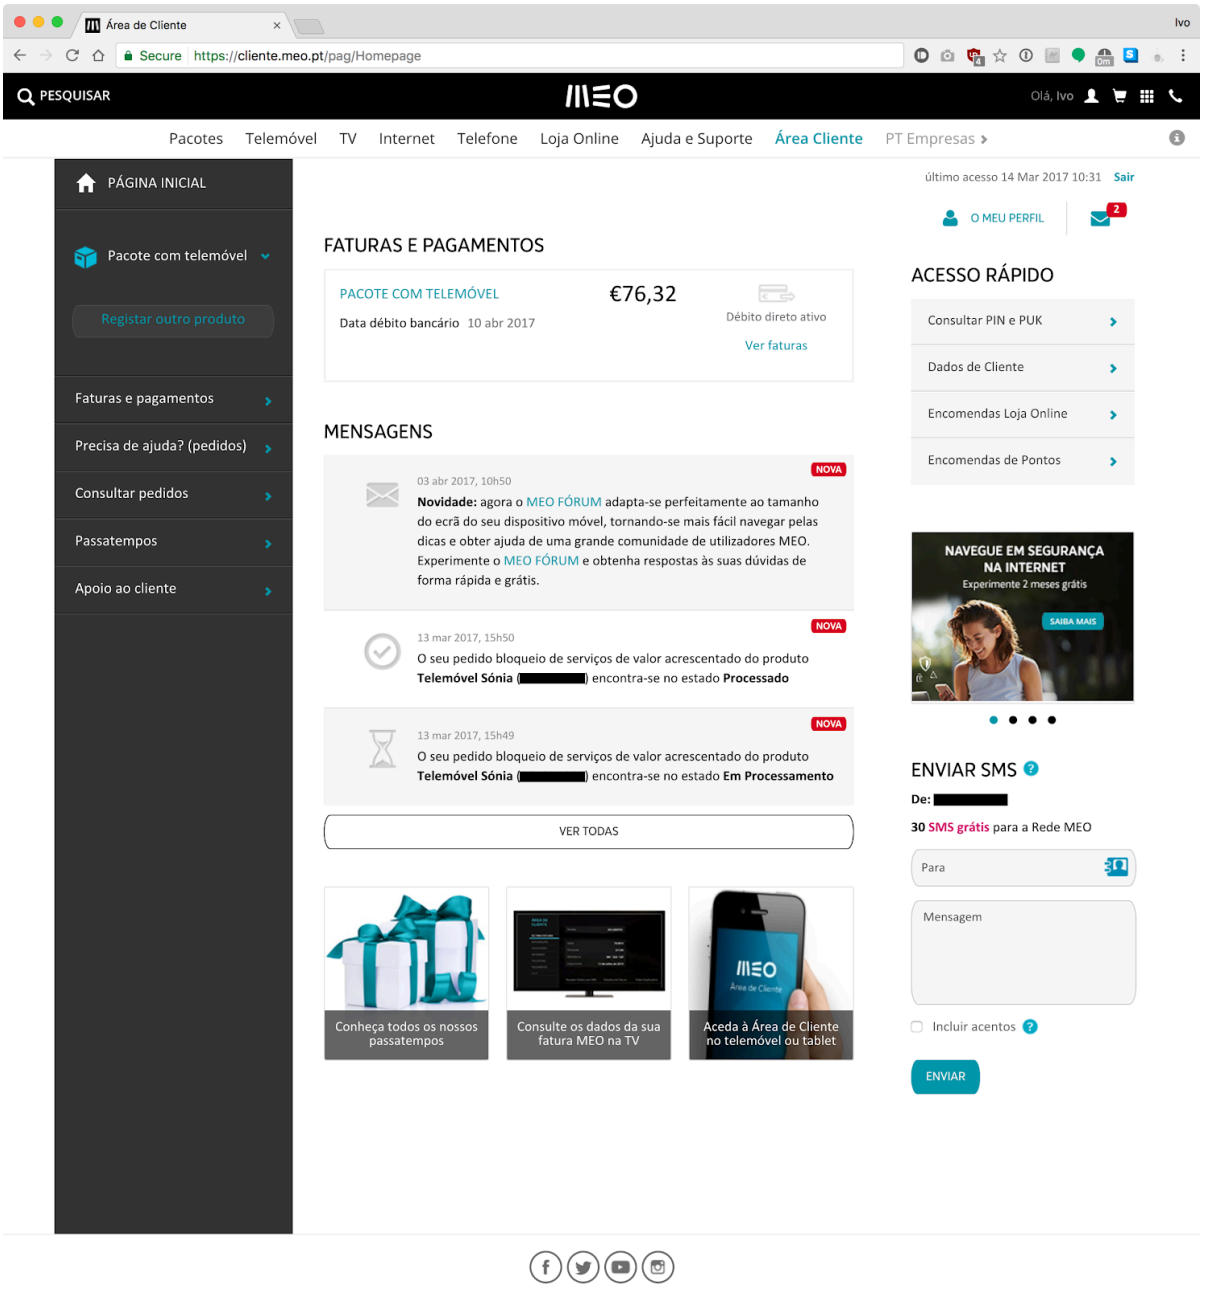

What I did: Specifications for the new MEO and PT Empresas websites, Sketches, Wireframes, User Testing and Card Sorting.

MEO customer self service website

I was responsible for the overhaul of the client's self service website for Portugal Telecom, as we tried to deliver an easy way for clients to do simple tasks or changes on their products and subscriptions without having to call support.

We used personas and did multiple usability tests with users during the whole process before the final version.

One of the biggest challenges was dealing with old and legacy services and merging them all together in one single and consistent website where users could do the most common tasks.

What I did: Specifications, Sketches, Wireframes, User Testing and Card Sorting

SAPO UX

The SAPO UX website was created to help designers and developers build more usable and accessible websites and applications. These guidelines were used internally at SAPO since 2009 (when I wrote the first draft) and we thought we should share it with everyone, hoping to make the (portuguese) web a better one, by giving free advice on usability, accessibility and SEO.

Usabilidade

A usabilidade é uma característica que faz com que algo seja fácil de usar. Um sistema usável é aquele que nós chamamos de intuitivo e "user friendly".

Aqui disponibilizamos um conjunto de regras e dicas de usabilidade para melhorar a experiência de utilização de websites e aplicações.

Regras e dicas de usabilidade ›

Acessibilidade

Ao contrário do que se pensa, a acessibilidade não serve apenas para facilitar o acesso a pessoas com necessidades especiais. Se conseguimos que o acesso seja mais fácil para estes utilizadores, automaticamente estamos a melhorar o acesso para todos os outros.

Consulte as nossas regras de acessibilidade para garantir que o acesso à informação é universal.

Regras e dicas de acessibilidade ›

SEO

Most of the content was written by me (from 2009) and updated throughout the following years at SAPO. I recently found out that it is being used as a source for the Portuguese Government Administrative Modernization Agency's (www.ama.gov.pt) usability guidelines for all websites for the public administration. So, our plan is (still) working :)

What I did: Content, Specifications, Wireframes, UI Design, HTML/CSS, WordPress integration

Several SAPO websites and apps

During my time as Head of UX at SAPO, I had the opportunity to work on multiple websites and mobile apps. Most of my work was writing the specifications, designing wireframes and workflows and validating the overall user experience before launch. Some of the most impactful projects I worked on were:

- **SAPO Desporto** (desporto.sapo.pt) - Helped design the first iteration of SAPO Desporto and was responsible for improving and simplifying the navigation for the following years. Also helped on the usability of the mobile apps.

- **SAPO Biz** (biz.sapo.pt) - Responsible for all the user experience of the backoffice for SAPO Biz. SAPO Biz helped creating online stores for anyone to sell their products.

- **SAPO Jornais** (jornais.sapo.pt) - One of the most successful sub-products of SAPO, is still today the second most visited (right after SAPO Mail). It is now part of SAPO24. I was responsible for the overall usability of the service, including the mobile apps.

- **SAPO Mag** (mag.sapo.pt) & **SAPO Lifestyle** (lifestyle.sapo.pt) - Two magazine-like websites that SAPO launched to try and gather a younger audience. Like most SAPO products, I was the one responsible for the overall usability.

Several MEO websites and apps

At SAPO, as part of the Portugal Telecom group, we had the opportunity to work on many other projects in multiple platforms (web, mobile, IPTV). Most of my work here was writing specifications, designing wireframes and workflows and providing usability and accessibility consultancy whenever needed. Some of the most impactful projects I worked on were:

- **MEO Interativo** (IPTV app) - The first time I worked on a TV app was to design and specify how the apps marketplace should work. There was no documentation on how interfaces should behave on a TV at all since not many people were designing UIs for TVs yet (SmartTVs weren't a thing at this time), but I think we did a good job.
    - Here's a brief documentation of the whole process: http://uxsapo.blogs.sapo.pt/5056.html
    - And a follow-up with user testing: http://uxsapo.blogs.sapo.pt/5317.html
- **MEO Kanal** (kanal.meo.pt) - The main idea behind MEO Kanal is to give anyone (as long as they are MEO clients) the possibility of creating their own TV channel. Just upload your contents and share your channel number (every channel gets a 6 digit number, available in all MEO boxes). I was responsible for the initial specification and wireframing, also defining the workflows.

    - Here's a brief documentation of the whole process: http://uxsapo.blogs.sapo.pt/5510.html

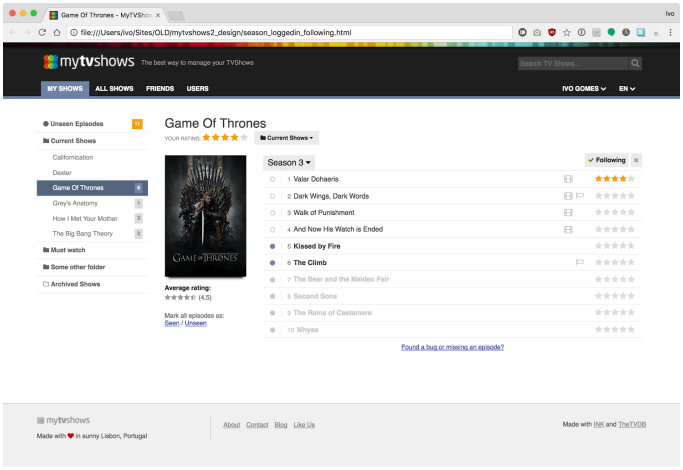

- **MEO Music** (desktop & mobile apps) - When Spotify was still not available in Portugal, MEO wanted to give its clients a music streaming service. I worked on the specification and wireframes for the desktop app and helped as a usability consultant for the mobile app.

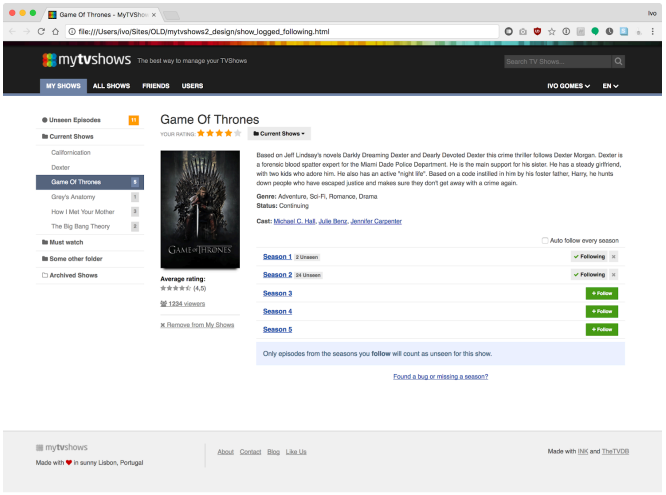

MyTVShows (2007-2016)

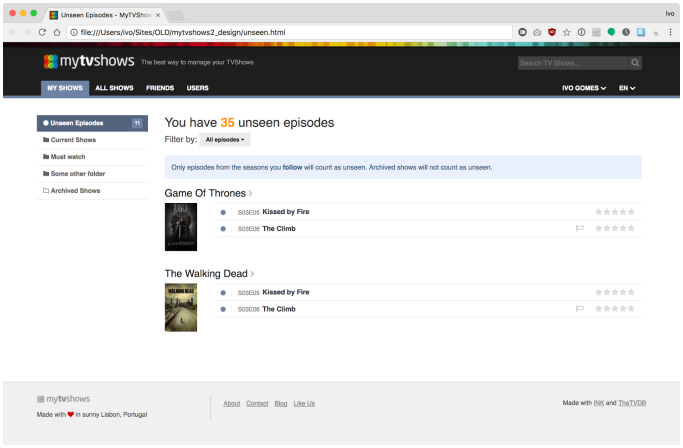

One of my pet projects for a few years. MyTVShows was a place where you could keep track of the TV shows you were watching. I started it as a way to practice a programming language (PHP) and it developed quickly into one of the most useful websites for people who watched multiple TV Shows.

Today, most media centers already tell you which episodes you watched and which ones you still have to watch, but when I started it, there was no alternative. I developed the entire website by myself: UI, UX, PHP, HTML/CSS, JavaScript. It was fun while it lasted, but I had to shut it down due to lack of time to keep working on it and after there was a problem with scalability (too many users wanting to use the service that was not designed for such heavy traffic). Here's a blog post I wrote about it: https://ivogomes.medium.com/mytvshows-is-dead-long-live-mytvshows-18907bbc4a47

Log (2004-2009)

Log is a small consultancy agency where I had the pleasure of working with multiple clients, namely:

- **CMVM** - Helped design and migrate the old CMVM website into a new one
- **Arquivo Nacional/Torre do Tombo** - Designed the websites for all the national archives (there's one for each district in Portugal) and the main one for Torre do Tombo. Curious to see that most of them are still online after almost 20 years at https://antt.dglab.gov.pt/ (including the specific ones for each district from Aveiro https://adavr.dglab.gov.pt/ to Viana do Castelo https://advct.dglab.gov.pt/
- **Workmedia** - Developed a Content Management System for the online publications of workmedia like Hipersuper, Meios&Publicidade, and Publituris.
